

IMSB(I-X) TUMAIR,
Islamabad

The background of the slide is a screenshot from a Scratch project. It features a light blue sky and green rolling hills at the bottom. A black helicopter is visible on the left side, flying over the hills. A large black oval with the word 'Start' in green text is centered in the sky area.

Start

Helicopter Game in
Scratch — Build,
Play, Improve

Core concept & player experience

The game is a side-scrolling survival challenge: the player taps Space to lift the helicopter and releases to fall.

Blocks approach from the right; contact or falling off-screen triggers an explosion and ends the run.

Movement & physics

Space key = impulse upward: apply a short upward velocity when Space is pressed.

Gravity: constantly add a small downward value each frame so the craft falls naturally.

Obstacle generation — blocks that create challenge

Continuously spawn block pairs (top and bottom) with a gap for the helicopter to pass. Vary vertical position and gap size over time to increase difficulty.

Gap variability

Randomise gap Y within safe bounds.
Gradually reduce gap size as score rises.

Horizontal speed

Move blocks left at a constant speed.

Collision detection & game-over flow

Collision rules: when helicopter touches any block OR its Y position goes below the stage floor or above the top limit — trigger the crash sequence.

- Stop player input
- Play explosion animation and sound
- Show final score

Scoring & progression

The score increments over time while the player survives — for example, +1 each second or +1 per block passed. Use the score to:

High score
